

Laboratory 5

Title of the Laboratory Exercise: Programs for process scheduling algorithms

1. Introduction and Purpose of Experiment

A Process Scheduler schedules different processes to CPU based on particular scheduling algorithms. There are various scheduling algorithms present in each group of operating system. By solving these problems students will be able use different scheduling algorithms as part of their implementation

2. Aim and Objectives

Aim

- To develop programs to implement scheduling algorithms

Objectives

At the end of this lab, the student will be able to

- Distinguish different scheduling algorithms
- Apply the logic of scheduling algorithms wherever required
- Create C programs to simulate scheduling algorithms

3. Experimental Procedure

- i. Analyse the problem statement
- ii. Design an algorithm for the given problem statement and develop a flowchart/pseudo-code
- iii. Implement the algorithm in C language
- iv. Compile the C program
- v. Test the implemented program
- vi. Document the Results
- vii. Analyse and discuss the outcomes of your experiment

4. Questions

Write program to simulate the following process scheduling algorithms. Calculate average waiting time and average turnaround time for processes under each scheduling algorithm.

Instructions: Assume all the processes arrive at the same time. For FCFS and SJF scheduling algorithms, read the number of processes/jobs in the system and their CPU burst times. For round robin scheduling algorithm, read the number of processes in the system, their CPU burst times and the size of the time slice. For priority scheduling algorithm, read the number of processes in the system, their CPU burst times and the priorities.

- a) First Come First Served
- b) Shortest Job First
- c) Priority
- d) Round Robin

5. Calculations/Computations/Algorithms

a) FCFS algo:-

- Step 1- Input the processes along with their burst time (bt).
- Step 2- Find waiting time (wt) for all processes.
- Step 3- As first process that comes need not to wait so waiting time for process 1 will be 0 i.e. $wt[0] = 0$.
- Step 4- Find waiting time for all other processes i.e. for process $i \rightarrow wt[i] = bt[i-1] + wt[i-1]$.
- Step 5- Find turnaround time = waiting_time + burst_time for all processes.
- Step 6- Find average waiting time = $\frac{\text{total_waiting_time}}{\text{no_of_processes}}$.
- Step 7- Similarly, find average turnaround time = $\frac{\text{total_turn_around_time}}{\text{no_of_processes}}$.

b) SJF algo:-

- 1. Sort all the process according to the arrival time.
- 2. Then select that process which has minimum arrival time and minimum Burst time.
- 3. After completion of process make a pool of process which after till the completion of previous process and select that process among the pool which is having minimum Burst time.

c) Priority algo:-

- 1- First input the processes with their burst time and priority.
- 2- Sort the processes, burst time and priority according to the priority.
- 3- Now simply apply [FCFS](#) algorithm.

d) Round Robin:-

- 1- Create an array `rem_bt[]` to keep track of remaining burst time of processes. This array is initially a copy of `bt[]` (burst times array)
- 2- Create another array `wt[]` to store waiting times of processes. Initialize this array as 0.
- 3- Initialize time : `t = 0`
- 4- Keep traversing the all processes while all processes are not done. Do following for i'th process if it is not done yet.
 - a- If `rem_bt[i] > quantum`
 - (i) `t = t + quantum`
 - (ii) `bt_rem[i] -= quantum;`
 - c- Else // Last cycle for this process
 - (i) `t = t + bt_rem[i];`
 - (ii) `wt[i] = t - bt[i]`
 - (ii) `bt_rem[i] = 0; // This process is over`

6. Presentation of Results:-

a)First Come First Served Program:-

```
// C program for implementation of FCFS
// scheduling
#include<stdio.h>
//Function to calculate average time
void findavgTime( int prs[], int n, int bt[])
{
    int wt[n], tat[n], total_wt = 0, total_tat = 0;

    // waiting time for first process is 0
    wt[0] = 0;
    // calculating waiting time
    for (int i = 1; i < n ; i++ ) {
        wt[i] = bt[i-1] + wt[i-1] ;
    }

    // calculating tat
    // bt[i] + wt[i]
    for (int i = 0; i < n ; i++){
        tat[i] = bt[i] + wt[i];
    }
    //Display processes along with all details
    printf("Prs.\tBt\tWt\tTAT \n");

    // Calculate total wt and total tat
    for (int i=0; i<n; i++)
    {
        total_wt = total_wt + wt[i];
        total_tat = total_tat + tat[i];
        printf(" %d ",(i+1));
        printf("\t%d ", bt[i] );
        printf("\t%d",wt[i] );
        printf("\t%d\n",tat[i] );
    }
    float s=(float)total_wt / (float)n;
    float t=(float)total_tat / (float)n;
    printf("Average waiting time = %.3f",s);
    printf("\n");
    printf("Average turn around time = %.3f ",t);
}

// Driver code
```

```
int main()
{
    int n;
    printf("Enter no of processes:-");
    scanf("%d",&n);
    //process id's
    int processes[n];
    int burst_time[n];
    printf("Enter burst times:- \n");
    for (size_t i = 0; i < n; i++)
    {
        processes[i]=i;
        scanf(" %d",&burst_time[i]);
    }

    findavgTime(processes, n, burst_time);
    return 0;
}
```

FCFS output:-

```
Enter no of processes:-3
Enter burst times:-
2 4 6
Prs.    Bt    Wt    TAT
1       2     0     2
2       4     2     6
3       6     6    12
Average waiting time = 2.667
Average turn around time = 6.667
PS F:\RUAS\5 sem\Operating system\Os lab\lab5\programs>
```

b) shortest job first (sjf) program:-

```
#include<stdio.h>
int main()
{
    int bt[20],p[20],wt[20],tat[20],i,j,n,total=0,pos,temp;
    float avg_wt,avg_tat;
    printf("Enter number of process:");
    scanf("%d",&n);

    printf("\nEnter Burst Time:\n");
    for(i=0;i<n;i++)
    {
        printf("p%d:",i+1);
        scanf("%d",&bt[i]);
        p[i]=i+1;
    }

    //sorting of burst times
    for(i=0;i<n;i++)
    {
        pos=i;
        for(j=i+1;j<n;j++)
        {
            if(bt[j]<bt[pos])
                pos=j;
        }

        temp=bt[i];
        bt[i]=bt[pos];
        bt[pos]=temp;

        temp=p[i];
        p[i]=p[pos];
        p[pos]=temp;
    }

    wt[0]=0;
```

```

for(i=1;i<n;i++)
{
    wt[i]=0;
    for(j=0;j<i;j++)
        wt[i]+=bt[j];

    total+=wt[i];
}

avg_wt=(float)total/n;
total=0;

printf("\nProcess\t    Burst Time    \tWaiting Time\tTurnaround Time");
for(i=0;i<n;i++)
{
    tat[i]=bt[i]+wt[i];
    total+=tat[i];
    printf("\n %d \t\t %d\t\t %d \t\t\t %d",p[i],bt[i],wt[i],tat[i]);
}

avg_tat=(float)total/n;
printf("\n\nAverage Waiting Time=%0.3f",avg_wt);
printf("\n\nAverage Turnaround Time=%0.3f\n",avg_tat);
}

```

SJF Output:-

```

Enter number of process:5

Enter Burst Time:
p1:8
p2:5
p3:9

```

7. Analysis and Discussions:-

○ **First Come First Served:-**

Given n processes with their burst times, the task is to find average waiting time and average turn around time using FCFS scheduling algorithm.

First in, first out (FIFO), also known as first come, first served (FCFS), is the simplest scheduling algorithm. FIFO simply queues processes in the order that they arrive in the ready queue.

In this, the process that comes first will be executed first and next process starts only after the previous gets fully executed.

○ **Shortest Job First**

Shortest job first (SJF) or shortest job next, is a scheduling policy that selects the waiting process with the smallest execution time to execute next. SJN is a non-preemptive algorithm.

- Shortest Job first has the advantage of having a minimum average waiting time among all scheduling algorithms.
- It is a Greedy Algorithm.
- It may cause starvation if shorter processes keep coming. This problem can be solved using the concept of ageing.
- It is practically infeasible as Operating System may not know burst time and therefore may not sort them. While it is not possible to predict execution time, several methods can be used to estimate the execution time for a job, such as a weighted average of previous execution times. SJF can be used in specialized environments where accurate estimates of running time are available.

○ **Priority**

Priority scheduling is one of the most common scheduling algorithms in batch systems.

Each process is assigned a priority. Process with the highest priority is to be executed first and so on.

Processes with the same priority are executed on first come first served basis. Priority can be decided based on memory requirements, time requirements or any other resource requirement

○ **Round Robin**

Round Robin is a CPU scheduling algorithm where each process is assigned a fixed time slot in a cyclic way.

- It is simple, easy to implement, and starvation-free as all processes get fair share of CPU.
- One of the most commonly used technique in CPU scheduling as a core.
- It is preemptive as processes are assigned CPU only for a fixed slice of time at most.
- The disadvantage of it is more overhead of context switching.

8. Conclusions

FCFS: - It is simple and easy to understand

IN SJF:-

- Shortest jobs are favored.
- It is provably optimal, in that it gives the minimum average waiting time for a given set of processes.

IN ROUND AND ROBIN:-

- Every process gets an equal share of the CPU.
- RR is cyclic in nature, so there is no starvation

IN PRIORITY:-

This Scheduling provides a good mechanism where the relative importance of each process maybe precisely defined.

9. Comments

1. Limitations of Experiments

FCFS limitation:-

In First Come First Serve scheduling the average waiting time is not optimal. ...

The First Come First Serve scheduling is Non-preemptive in nature. ...

As the First come First Serve scheduling is Non-preemptive, it does not understand the priority of processes.

Round and robin limitation:

If slicing time of OS is low, the processor output will be reduced. This method spends more time on context switching. Its performance heavily depends on time quantum. Priorities cannot be set for the processes

Priority scheduling limitation:-

The problem occurs when the operating system gives a particular task a very low priority, so it sits in the queue for a larger amount of time, not being dealt with by the CPU. If this process is something the user needs, there could be a very long wait, this process is known as "Starvation" or "Infinite Blocking".

SJF Limitations:-

SJF may cause starvation, if shorter processes keep coming. This problem is solved by aging. It cannot be implemented at the level of short term CPU scheduling.
